

IsoTek Systems V5 Titan

POWER POWER CONDITIONER

Designed for heavy-duty use, the IsoTek V5 Titan offers 153,000A of surge protection and 75,000A continuous protection. This protection ensures the safety of power amplifiers and speakers. The V5 Titan features a direct coupled and star-earthed architecture with a large input transformer and four smaller output transformers. IsoTek upgraded its PCBs with increases in copper loading, inductance, and current handling as part of the V5 architecture.

System Link

The V5 Titan's System Link output allows multiple IsoTek conditioners to connect to a single wall socket while maintaining a star-earth architecture. This is particularly advantageous for systems with power amp sockets along a rear wall and the source and preamplifier electronics along a side wall.

In our test, we found that adding the V5 Titan effectively removed mains-related noise

“ Adding the V5 Titan effectively removed mains-related noise without undermining the system's performance.

without undermining the system's performance. That cleaner power lowers the noise floor of devices connected to the V5 Titan, making the electronics sound more unfettered by the mains and how they're supposed to sound. The absence of the V5 Titan imposing its sonic footprint on the system's sound makes its performance hard to describe. However, its ability to bring calm to any system makes the IsoTek V5 Titan hard to give up!
